Selection Guide

1 Select a type

Refer to the list of parts (p. 022), Select by Product Characteristics (p. 025), Select by Driver (p. 025), and Applications (p. 026) sections in order to select the best coupling for the application at hand.

2 Select a size

Select a size with a nominal torque (for SERVOFLEX, a rated torque) higher than the load torque. Make sure to also consider load conditions when making a selection.

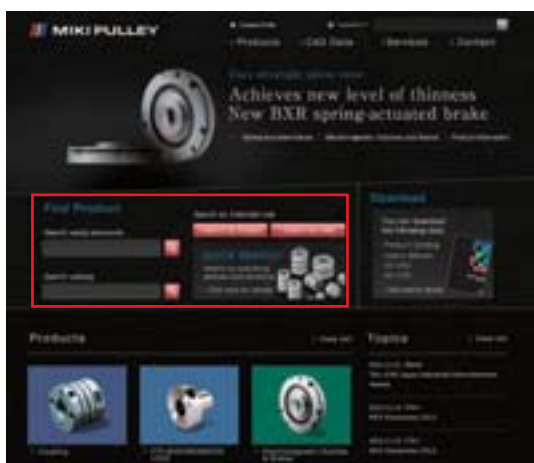

3 Check the max. bore diameter

When selecting a model, make sure to check that the mounting shaft diameter is smaller than the maximum bore diameter of the coupling.

4 Overview

Once the model has been selected, check the rated torque, maximum rotation speed, dimensions, and other specifications again to confirm that they satisfy the usage conditions.

Quick Search

You can use the website quick search feature to narrow down your search for couplings.

 A screenshot of the 'Find Coupling' search form. It includes fields for 'Product' (set to 'All products'), 'Load torque' (with 'min' or 'greater' options), 'Service factor' (set to '1.5'), 'Bore diameter: d1 (small diameter)', 'Bore diameter: d2 (large diameter)', 'External diameter', 'Shaft length', 'Shaft connection method', and 'Direction' (set to 'one'). There is a 'Search' button at the bottom.

 A screenshot of the 'Find Coupling' search form, showing the 'Actuator' and 'Motor' sections. Each section has 'Manufacturer' and 'Product Number' dropdown menus. A 'Search' button is located at the bottom.

 A screenshot of the 'Find Coupling' search form, showing the 'Type' section. It includes dropdown menus for 'Type', 'Maximum torque', 'Motor shaft diameter', 'Shaft diameter on the following side', 'External diameter', 'Shaft length', and 'Shaft connection method'. A 'Search' button is at the bottom.

Select by Product Characteristics

Select by Drive

Applications

Product model ALS(R)

Employed device Vacuum Pump

MIKI PULLEY STARFLEX coupling for connecting the drive unit.
Simple structure and easy maintenance.

Product model CF-A(OZ)

Employed device Pleasure Boat

CENTAFLEX coupling and floating shaft (for high-speed rotation) are used to connect the engine and the propeller.

Product model SFC

Employed device Dicing Saw

SERVOFLEX for connecting the servo motor and ball screw. It is used for ultra-precision machining of semiconductor wafers.

Product model SFF

Employed device CNC Lathe

Ultra-high stiffness coupling SFF model for connecting the servo motor and feed shaft. The rated torque is higher than the conventional models, and the coupling size and the moment of inertia can be reduced.

SERVOFLEX coupling for the head of a chip mounter.

Product model SFC

Employed device Chip Mounter

Product model STF

Employed device General-purpose Feed Shaft

The high damping performance STEPFLEX coupling is used to connect the stepper motor and the ball screw.

No backlash

Max. rated torque [N·m]	8000
Bore ranges [mm]	φ 3 ~ 115
Operating temperature [°C]	-30 ~ 120(100)
Drive	Servomotor/stepper motor
Applications	Machine tool / semiconductor manufacturing equipment / printing press / packing machine

High-stiffness and Low-inertia Servomotor Couplings

Metal disc couplings developed for high-speed and high-precision positioning and ultra-precise control of servomotors, etc. While achieving high stiffness, high torque, low inertia, and high response speed, these couplings are also flexible in the torsional direction, in the uneven directions, and in the shaft direction, and are totally free from backlash. Models with various characteristics are available, and each model has a single element type that emphasizes stiffness and a double element type that emphasizes flexibility.

Product Lineup

SFC

Applications: NC lathe, machining center, chip mounter, actuator, SCARA robot, semiconductor manufacturing equipment

Max. rated torque	[N·m]	250
Bore ranges	[mm]	φ 3 ~ 45

High Stiffness and Ultra-low Inertia

Small- and medium-capacity model, which is made of a high-strength aluminum alloy and whose outer hub diameter is linked to the shaft diameter to achieve a ultra-low inertia ideal for high-speed rotation. Three different shapes are available depending on the combination of bore diameters you use.

TYPE A

TYPE B

TYPE C

SFC(SA2)

SFC(DA2)

SFC(SA2/DA2)BC

*1 For surface processing of the clamping bolts, black coating is applied only for #002.

*2 The collar material in the marked area is S45C in sizes #080 to #100, and the surface finishing is trivalent chrome treatment.

*3 The bolt surface finishing in the marked area is anti-rust coating in sizes #080 to #100.

Simple and Reliable Connection

A single clamping method is used for connection to the shaft. The clamping hub is shock and vibration proof, enabling reliable connection and helping to substantially reduce mounting time. A special jig is used for centering to achieve an extremely high concentricity.

Wide Variety of Options

A wide variety of options such as a tapered shaft, length-specified special order, and keyway milling application are available. You can combine options to meet your desired specifications.

SFS

Applications: Machine tool, printing press, packing machine, coater/coating machine

Max. rated torque	[N·m]	800
Bore ranges	[mm]	φ 8 ~ 60

Wide Variations

SERVOFLEX standard model. 18 types with different numbers of elements, distances between shafts, shaft connection methods, etc. are available. You can select the electroless nickel plating for the pilot bore and key/set screw.

Parts Delivery

You can order the parts of the coupling to be delivered instead of an assembled coupling, so you can use this coupling in a design in which the assembled coupling could not be mounted. You can also order an assembled coupling to be delivered or combine different types of hubs.

SFH

SFF

Applications: NC lathe, machining center, chip mounter, electrical discharge machine

Max. rated torque	[N · m]	1000
Bore ranges	[mm]	φ 8 ~ 80

Ultra-high Stiffness and Ultra-low Inertia

Ultrahigh torsional stiffness, achieving 1.5 times the rated torque of the current model and low inertia.

SFF(SS)

High-precision Clamping Connection

The number of mounting bolts has been reduced substantially. You can remarkably reduce mounting time.

Frictional Coupling for Large Diameters

This model supports frictional coupling for larger-diameter shafts than the previous models.

Tapered shaft

SFF(DS)

Flange-mounted

SFM

Application: Machine tool main shaft

Max. rated torque	[N · m]	1000
Bore ranges	[mm]	φ 12 ~ 80

SFM(SS)

SFH

Applications: Double column machining center, printing press, testing machinery, wind turbine generator

Max. rated torque	[N · m]	8000
Bore ranges	[mm]	φ 22 ~ 115

SFH(S)

SFH(G) □ K- □ K

Max. Rated Torque 8000N·m

This model was developed to transmit a large torque, has an extremely high torsional stiffness, and enables precise shaft rotation and ultra-precise control.

Total Length Can Be Specified

The total length can be specified for a type that connects the middle of the element using a floating shaft.

Customization Cases

SFC Model simple antirust

The all-stainless-steel construction provides even better rust-proofing.

SFC Model with slit plate

A slit plate is mounted between the hubs to allow it to be used with position detection sensors such as an encoder and photo sensor.

SFC Model with long spacer

This is a specification for when the mounting distance between shafts is long. It can be used in applications such as synchronization of gantry mechanism.

SFF Model For non-excitation brake assemblies

The device design can be made more compact by forming the spline to the outer diameter of the SFF model and using it as the rotor hub for a Miki Pulley non-excitation brake.

For details, please visit our website.

FAQ

Q1 What are the durability and aging deterioration of the SERVOFLEX?

- A** We conduct a torsional durability test by applying a load larger than the rated torque. SERVOFLEX passed the test by withstanding the metal fatigue limit of 10 million cycles of repeated load. SERVOFLEX is all made of metal materials so the deterioration is extremely slow, and it is able to transmit torque with high precision for a long period of time.

Torsional characteristics of the SERVOFLEX before and after the durability test with 10 million cycles of repeated load

Q2 When a coupling is mounted, the driven shaft runs out. What is the cause?

- A** The runout of a driven shaft caused by a coupling is mainly attributed to the counterforce of the shaft caused by insufficient centering. All of the SERVOFLEX series are assembled using high-precision special jigs to ensure high concentricity of the bores on the left and right. The counterforce of the shaft is extremely small so the runout of the driven shaft can be minimized.

Q3 Noise and vibrations occurred during use of a metal disc coupling. Please tell me how to prevent them.

- A** For a servo motor, noise and vibrations can be suppressed by setting the machine resonance suppression filter to its natural frequency in the control system. For a stepper motor, vibrations can be absorbed and suppressed by changing the rotation speed or using a STEPFLEX coupling with high damping ability.

Before adjusting the resonant filter of the servo motor

After adjusting the resonant filter of the servo motor

Q4 Can enough torque be transmitted using the clamping method for connection to the shaft?

- A** Our torque transmission test uses a sufficient safety factor, so slip of the connection caused by the connection method will not occur when using the rated torque in the catalog. A keyway can be milled into the clamping hub. If you are interested, please refer to P.041 Keyway Milling Option.

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * Check the Standard Bore Diameter list as rated torque may be restricted by the holding power of the shaft connection component. * Max. rotation speed does not take into account dynamic balance. * Torsional stiffness values given are measured values for the element alone. * The moment of inertia and mass are measured for the maximum bore diameter.

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * The øDB value is measured assuming that the head of the clamping bolt is larger than the external diameter of the hub. * The K dimension is the inner diameter of the element. For d2 dimension exceeding this value, shaft can be inserted only up to LF dimension to the d2 side hub. * The nominal diameter for the clamping bolt M is equal to the quantity minus the nominal diameter of the screw threads, where the quantity is for a hub on one side. * The figures in parentheses () for the SFC-010 are the values when d1 or d2 is ø8 mm.

	d2																																												

* The shaft tolerance for standard bore diameter is h7 (h6 or g6): designation B. However, for a bore diameter of ø35, the shaft tolerance is $\frac{+0.010}{-0.009}$. * Shaft tolerances j6/k6: designations J/K are optional, and are only supported for bore diameters marked with ○. * Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

How to Place an Order

SFC-025SA2-10B-14K

Size ———
 Type ———
 SA2: Single element
 Bore diameter d1 (Small diameter) ———
 Bore diameter d2 (Large diameter) ———

Supported shaft tolerance
 B: h7(h6,g6) shaft
 J: j6 shaft (Option)
 K: k6 shaft (Option)

* For nominal bore diameter, select d1 (small diameter)-d2 (large diameter) in that order.

* If d1=d2 (same diameters), select B, J, and K in that order.

Double Element Type

* The shaft tolerance for standard bore diameter is h7 (h6 or g6): designation B. However, for a bore diameter of ø35, the shaft tolerance is $^{+0.010}_{-0.009}$. * Shaft tolerances j6/k6: designations J/K are optional, and are only supported for bore diameters marked with ○. * Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

How to Place an Order

SFC-025DA2-10B-14B

Size

Type

DA2: Double element

Bore diameter d1
(Small diameter)

Bore diameter d2
(Large diameter)

Supported shaft tolerance

B: 7(h6,g6) shaft

J: 6 shaft (Option)

K: 6 shaft (Option)

* For nominal bore diameter, select d1 (small diameter)-d2 (large diameter) in that order.

* If d1=d2 (same diameters), select B, J, and K in that order.

Option Tapered shaft supported

Allows coupling via a clamp hub when a taper adapter is mounted on the tapered shaft of a servo motor.

* The shaft tolerance for standard bore diameter is h7 (h6 or g6): designation B. However, for a bore diameter of ø35, the shaft tolerance is $\frac{h7}{h6}$. * Shaft tolerances j6/k6: designations J/K are optional, and are only supported for bore diameters marked with ○. * Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N · m].

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * The nominal diameter for the clamping bolt M is equal to the quantity minus the nominal diameter of the screw threads, where the quantity is for a hub on one side. * The figures in parentheses () for the SFC-010 are the values when d1 or d2 is ø8 mm. * Compatible lengths L range from the minimum L dimension to the maximum L dimension shown in the above table. Specify in 1 mm units. * When the L dimension is shorter than the standard, the left/right clamping bolt phases will be off by 45°. * Check "Standard Bore Diameters" for SFC (DA2) for the standard bore diameters.

How to Place an Order

SFC-040DA2-14B-15B-L60

Size _____ Length designation
Type _____ * Specify the L dimension in 1 mm increments.
DA2: Double element
Supported shaft tolerance
Bore diameter d1 (Small diameter) _____ B : h7(h6,g6), (Option K : k6, J : j6)
Bore diameter d2 (Large diameter) _____

Option For keyway milling applications

If you are using a keyed shaft, we can mill a keyway in the clamping hub to your specifications.

* The shaft tolerance for standard bore diameter is h7 (h6 or g6): designation B. However, for a bore diameter of $\phi 35$, the shaft tolerance is ± 0.025 . * Shaft tolerances j6/k6: designations J/K are optional, and are only supported for bore diameters marked with ○. * Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

How to Place an Order

SFC-060SA2-12BH-14KJ

Size ———
 Type ———
 SA2: Single element
 DA2: Double element
 Bore diameter d1 (Small diameter) ———
 Affixing method
 KJ: k6 shaft + JS9 keyway
 Bore diameter d2 (Large diameter) ———
 Affixing method
 BH: h7(h6,g6) shaft + H9 keyway

* For nominal bore diameter, select d1 (small diameter) -d2 (large diameter) in that order.

* If d1=d2 (same diameters), select B, J, and K in that order.
 B · J · K · BH · BJ · JH · JJ · KH · KJ

Option Clean room compatible / Single element type

It is a clean room compatible product that has been cleaned, assembled (ISO class 6) and packed in consideration of its use in clean rooms.

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * Check the Standard Bore Diameter list as rated torque may be restricted by the holding power of the shaft connection component. * Max. rotation speed does not take into account dynamic balance. * Torsional stiffness values given are measured values for the element alone. * The moment of inertia and mass are measured for the maximum bore diameter.

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * The K dimension is the inner diameter of the element. For d2 dimension exceeding this value, shaft can be inserted only up to LF dimension to the d2 side hub. * The nominal diameter for the clamping bolt M is equal to the quantity minus the nominal diameter of the screw threads, where the quantity is for a hub on one side. * You can choose from two types of grease for clamp bolts: low dust generation grease and fluorine grease.

How to Place an Order

SFC-030SA2-CC-10B-14B

Size
Type
SA2: Single element
Grease type
CC: Low dust generation grease
CF: Fluorine grease

Supported shaft tolerance
B : h7(h6,g6) shaft

* Bore diameter of ø35, the shaft tolerance is $^{+0.010}_{-0.025}$.
* For nominal bore diameter, select d1 (small dia.)-d2 (large dia.) in that order.

Bore diameter d2 (Large diameter)

Bore diameter d1 (Small diameter)

Option Clean room compatible / Double element type

It is a clean room compatible product that has been cleaned, assembled (ISO class 6) and packed in consideration of its use in clean rooms.

* Types A / B / C are automatically specified by Miki Pulley according to the combination of bore diameters you select, and cannot be specified by the customer. * The K dimension is the inner diameter of the element. For d2 dimension exceeding this value, shaft can be inserted only up to LF dimension to the d2 side hub. * The nominal diameter for the clamping bolt M is equal to the quantity minus the nominal diameter of the screw threads, where the quantity is for a hub on one side. * You can choose from two types of grease for clamp bolts: low dust generation grease and fluorine grease.

Standard bore diameters (Low dust generation grease)

* The shaft tolerance for standard bore diameter is h7 (h6 or g6): designation B. However, for a bore diameter of ø35, the shaft tolerance is $^{+0.010}_{-0.025}$. * Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters. * Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

How to Place an Order

SFC-030DA2-CC-10B-14B

Size
Type
DA2: Double element
Grease type
CC: Low dust generation grease
CF: Fluorine grease

Supported shaft tolerance
B : h7(h6,g6) shaft

* Bore diameter of ø35, the shaft tolerance is $^{+0.010}_{-0.025}$.
* For nominal bore diameter, select d1 (small dia.)-d2 (large dia.) in that order.

Bore diameter d2 (Large diameter)

Bore diameter d1 (Small diameter)

Items Checked for Design Purposes

■ Spring characteristics SFC (SA2)

■ Axial load and amount of displacement

■ Spring characteristics SFC (DA2)

■ Axial load and amount of displacement

■ Parallel misalignment direction load and amount of displacement

Special items to take note of

You should note the following to prevent any problems.

- (1) Always be careful of parallel, angular, and axial misalignment.
- (2) Always tighten bolts with the specified torque.

Precautions for handling

Couplings are assembled at high accuracy using a special mounting jig to ensure accurate concentricity of left and right internal diameters. Take extra precautions when handling couplings, should strong shocks be given on couplings, it may affect mounting accuracy and cause the parts to break during use.

- (1) Couplings are designed for use within an operating temperature range of -30°C to 100°C . Although the couplings are designed to be waterproof and oil proof, do not subject them to excessive amounts of water and oil as it may cause part deterioration.
- (2) Handle the element with care as it is made of a thin stainless steel metal disc, also making sure to be careful so as not to injure yourself.
- (3) Do not tighten up clamp bolts until after inserting the mounting shaft.
- (4) Mounting shaft is assumed to be a round shaft.

Mounting

- (1) Check that coupling clamping bolts have been loosened and remove any rust, dust, oil residue, etc. from inner diameter surfaces of the shaft and couplings. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Be careful when inserting the couplings into the shaft so as not to apply excessive force of compression or tensile force to the element. Be particularly careful not to apply excessive compressing force needlessly when inserting couplings into the paired shaft after attaching the couplings to the motor.
- (3) With two of the clamp bolts loosened, make sure that couplings move gently along the axial and rotational directions. Readjust the centering of the two shafts if the couplings fail to move smoothly enough. This method is recommended as a way to easily check the concentricity of the left and right sides. If unable to use the same method, check the mounting accuracy using machine parts quality control procedures or an alternative method.

- (4) As a general rule, round shafts are to be used for the paired mounting shaft. If needing to use a shaft with a different shape, be careful not to insert it into any of the locations indicated in the diagrams below. (Grayed areas indicate areas wherein clamping hub shifts when clamped. Do not allow keyways, D-shaped cuts, or other insertions in these areas.) Placing the shaft in an undesirable location may cause the couplings to break or lead to a loss in shaft holding power. It is recommended that you use only round shafts to ensure full utilization of the entire range of coupling performance.

Proper mounting examples

Poor mounting examples

- (5) Insert and mount each shaft far enough in that the paired mounting shaft touches the shaft along the entire length of the clamping hub of the coupling (LF dimension), as shown in the diagram below, and does not interfere with the elements, spacers or the other shaft. In addition, restrict the dimensions between clamping hub faces (S dimensions in the diagram) within the allowable misalignment of the axial direction displacement with respect to a reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Model	LF [mm]	S [mm]
SFC-002	5.9	0.55
SFC-005	7.85	1
SFC-010	9.15	1.05
SFC-020	10.75	1.65
SFC-025	10.75	1.9
SFC-030	12.4	2.5
SFC-035	15.5	3
SFC-040	15.5	3
SFC-050	20.5	2.4
SFC-055	24	2.6
SFC-060	25.2	3.2
SFC-080	30	8
SFC-090	30	8.3
SFC-100	30	9.8

- (6) Check to make sure that no compression or tensile force is being applied along the axial direction before tightening up the two clamp bolts. Use a calibrated torque wrench to tighten the clamp bolts to within the tightening torque range listed below.

Model	Nominal bolt dia.	Tightening torque [N·m]		
		Standard	Clean room compatible	
			CC Low dust	CF Fluorine
SFC-002	M1.6	0.23 ~ 0.28	-	-
SFC-005 (SFC-010)	M2	0.4 ~ 0.5	-	-
SFC-010 · 020 · 025	M2.5	1.0 ~ 1.1	0.5	0.9
SFC-030	M3	1.5 ~ 1.9	1.5	3.2
SFC-035 · 040	M4	3.4 ~ 4.1	4	7.7
SFC-050	M5	7.0 ~ 8.5	7	12
SFC-055 · 060	M6	14 ~ 15	13	22.5
SFC-080 · 090 · 100	M8	27 ~ 30	27	45

* Use M2 bolts on SFC-010SA2/DA2 models with holes with a diameter of $\phi 8$ mm.

* The start and end numbers for the tightening torque ranges are between the minimum and maximum values. Tighten bolts to a tightening torque within the specified range for the model used.

Suitable torque screwdriver / torque wrench

Nominal bolt dia.	Standard		CC Low dust		CF Fluorine	
	Torque screwdriver/wrench	Hexagon bit/head	Torque screwdriver/wrench	Hexagon bit/head	Torque screwdriver/wrench	Hexagon bit/head

M8	N50LCK	50HCK 6mm	N50LCK	50HCK 6mm	N50LCK	50HCK 6mm

* Torque driver (wrench) , Hexagon bit (head) models indicated above are the products of NAKAMURA SEISAKUSYO Co., Ltd.

Items Checked for Design Purposes

Length-specified special order parts option

Specify any length for the length-specified special order option for the SERVOFLEX SFC (DA2). Use the following formula to calculate the allowable parallel misalignment value, adjust it to be no greater than that value, and then mount the coupling.

Options for keyway milling

Options for keyway milling are available on request. However, because they are designed such that torque is transferred to the friction coupling by the clamp mechanism, care should be taken not to exceed the coupling's permitted torque during use. Note also the following issues:

- (1) Only ever use keys that are no wider than the keyway. Using keys that are a tight fit could result in damage during mounting or operation.
- (2) The positional accuracy of keyway milling is visual. If positional accuracy relative to keyway hubs is required, contact Miki Pulley.
- (3) Using JS9 class tolerances provides a tight fit, so couplings may be compressed when mounted on shafts. Take care not to further compress the couplings.
- (4) Setting the fit of the key and keyway too loosely may result in play that generates dust. Also take care that the key does not come loose.
- (5) Adding a set screw over the keyway is not recommended as it may lower clamp performance, and the set screw may also become loose within the torque range you use or during forward/reverse operation. It may also impair the structural strength of the clamping hub or damage the coupling.

Selection order of nominal bore diameters when ordering

When specifying bore diameters, you should basically specify d1 (small diameter)-d2 (large diameter), and always specify d2 for taper adapters mounted on tapered shafts. However, where d1=d2 (same diameters), note the selection order below for each nominal bore diameter when ordering.

Nominal bore diameter symbol	Shaft tolerance	Keyway tolerance	Type	Selection diameter	Selection order
B	h7 (h6,g6)	-	Standard	d1/d2	1
J	j6	-	Option	d1/d2	2
K	k6	-	Option	d1/d2	3
BH	h7 (h6,g6)	H9	Option	d1/d2	4
BJ	h7 (h6,g6)	JS9	Option	d1/d2	5
JH	j6	H9	Option	d1/d2	6
JJ	j6	JS9	Option	d1/d2	7
KH	k6	H9	Option	d1/d2	8
KJ	k6	JS9	Option	d1/d2	9
BC	Tapered shaft supported		Option	d2	10

Clamp bolts

Use MIKI PULLEY-specified clamp bolts because they are processed with solid lubricant coating (except for SFC-002 M1.6). Applying adhesives to prevent loosening, oil, or the like to a clamp bolt will alter torque coefficients due to those lubricating components, creating excessive axial forces and potentially damaging the clamp bolt or coupling. Consult MIKI PULLEY before using such products.

Surface processing of coupling bore diameter

The bore diameters may or may not have surface processing in some components due to the circumstances of processing. This does not affect coupling performance. Consult Miki Pulley if your usage conditions require that bore diameters be surface processed or not.

Points to consider regarding the feed screw system

In feed screw systems using a stepper motor or servo motor, the pulsation natural frequency of the stepper motor and the torsional natural frequency of the system as a whole may cause the system to resonate, or the gain adjustment of the servo motor may cause the system to oscillate.

If resonance occurs, the resonant rotation speed must be skipped, or if oscillation occurs, adjustment will need to be made such as by using the filter function or other electrical control system to resolve the issue.

In either instance, to handle resonance and oscillation, it will be necessary to take into account the torsional natural frequency for the system overall during the design stage, including the torsional stiffness for the coupling and feed screw section and the moment of inertia and other characteristics.

How to find the natural frequency of a feed screw system

Select a coupling based on the standard torque or maximum torque of the servo motor.

Next, find the overall natural frequency, N_f , from the torsional stiffness of the coupling and feed screw, K , the moment of inertia of driving side, J_1 , and the moment of inertia of driven side, J_2 , for the feed screw system shown below.

Natural frequency of overall feed screw system N_f [Hz]

$$N_f = \frac{1}{2\pi} \sqrt{K \left(\frac{1}{J_1} + \frac{1}{J_2} \right)}$$

K : Torsional stiffness of the coupling and feed screw [N · m/rad]
 J_1 : Moment of inertia of driving side [kg · m²]
 J_2 : Moment of inertia of driven side [kg · m²]

Torsional spring constant of coupling and feed screw K [N · m/rad]

$$\frac{1}{K} = \frac{1}{K_c} + \frac{1}{K_b}$$

K_c : Torsional spring constant of coupling [kg · m²]
 K_b : Torsional spring constant of feed screw [kg · m²]

Driving moment of inertia J_1 [kg · m²]

$$J_1 = J_m + \frac{J_c}{2}$$

J_m : Moment of inertia of servomotor [kg · m²]
 J_c : Moment of inertia of coupling [kg · m²]

Driven moment of inertia J_2 [kg · m²]

$$J_2 = J_b + J_t + \frac{J_c}{2}$$

J_b : Moment of inertia of feedscrew [kg · m²]
 J_t : Moment of inertia of table [kg · m²]
 J_c : Moment of inertia of coupling [kg · m²]

Moment of inertia of table J_t [kg · m²]

$$J_t = \frac{M \times P^2}{4\pi^2}$$

M : Mass of table [kg]
 P : Lead of feed screw [m]

Since it is easier for oscillation to occur when the gain margin with natural frequency is 10 dB or lower, it is necessary for the natural frequency to be set high with a therefore higher gain margin at the design stage, or to adjust the natural frequency using the servomotor's electric tuning function (filter function) so as to avoid oscillation.

Selection

- (1) Find the torque T_a applied to the coupling using the output capacity, P , of the driver and the usage speed, n .

$$T_a [\text{N}\cdot\text{m}] = 9550 \times \frac{P [\text{kW}]}{n [\text{min}^{-1}]}$$

- (2) Determine the factor K from the load properties, and find the corrected torque, T_d , applied to the coupling.

$$T_d [\text{N}\cdot\text{m}] = T_a [\text{N}\cdot\text{m}] \times K \text{ (see below)}$$

Load properties	Constant	Vibration : Small	Vibration : Medium	Vibration : Large
				
K	1.0	1.25	1.75	2.25

For servo motor drive, multiply the maximum torque, T_s , by the usage factor $K = 1.2$ to 1.5 .

$$T_d [\text{N}\cdot\text{m}] = T_s [\text{N}\cdot\text{m}] \times (1.2 \text{ to } 1.5)$$

- (3) Set the size so that the rated coupling torque, T_n , is higher than the corrected torque, T_d .

$$T_n [\text{N}\cdot\text{m}] \geq T_d [\text{N}\cdot\text{m}]$$

- (4) The rated torque of the coupling may be limited by the bore diameter of the coupling. See the Specifications and Standard Bore Diameters tables.
- (5) Check that the mount shaft is no larger than the maximum bore diameter of the coupling.

* Contact MIKI PULLEY for assistance with any device experiencing extreme periodic vibrations.

Easy selection chart

Select a coupling size based on the rated output and the rated/maximum torque of the ordinary servo motor. The torque characteristics of servo motors vary between manufacturers, so check the specifications in the manufacturer catalog before finalizing a coupling size selection.

* Bore diameters marked with ● or numbers are supported as the standard bore diameters. Consult Miki Pulley regarding special arrangements which may be possible for other bore diameters.

* Bore diameters whose fields contain numbers are restricted in their rated torque by the holding power of the shaft connection component because the bore diameter is small. The numbers indicate the rated torque [N·m].

* Where a bore diameter is not given above and is small, please check first; model may be restricted in its rated torque.

* The recommended processing tolerance for paired mounting shafts is the h7 (h6 or g6) class. However, for a bore diameter of ø35, the shaft tolerance is $+0.010$ -0.025 .

* There may be limitations on the rated torque caused by the holding power of the coupling shaft section. If the bore diameter is not standard and is small, please check first.

* Max. rotation speed does not take into account dynamic balance.

* The moment of inertia and mass are measured for the maximum bore diameter.

* If you require a coupling with an LS dimension other than that for SFS(G) type, contact Miki Pulley with your required dimension. Please contact Miki Pulley for assistance if LS ≥ 1000.

* The nominal diameters of each bolt and tap are equal to the quantity minus the nominal diameter of the screw threads times the nominal length.

* The machining tolerance for paired mounting shafts of the hub on the friction-coupled side is h7 (h6 or g6) class.

How to Place an Order

SFS-08G-20M-16C LS=500

Size
Types
S: Single element
W: Double element
G: Floating shaft
Bore diameter d1
Affixing method
M: Frictional coupling

Spacer length
* Use mm units for LS dimensions.
* Leave blank for standard spacers.

[d2] C
C: Tapered shaft hub
* Select d2 for C.

SFS Models

Items Checked for Design Purposes

Special Items to Take Note of

You should note the following to prevent any problems.

- (1) Always be careful of parallel, angular, and axial misalignment.
- (2) Always tighten bolts with the specified torque.

Precautions for Handling

SFS models are delivered as components. Select whether to assemble by mounting flange hubs on each shaft and coupling shafts in both directions by mounting the element last, while centering, or to assemble by completing couplings first and then inserting them onto the shafts.

When using the assembly method that completes couplings first, take extra precautions when handling couplings. Subjecting assembled couplings to strong shocks may affect mounting accuracy and cause the parts to break during use.

- (1) Couplings are designed for use within an operating temperature range of -30° C to 120° C. Although the couplings are designed to be waterproof and oilproof, do not subject them to excessive amounts of water and oil as it may cause part deterioration.
- (2) Handle the element with care as it is made of a thin stainless steel metal disc, also making sure to be careful so as not to injure yourself.
- (3) For frictional coupling types, do not tighten up pressure bolts until after inserting the mounting shaft.
- (4) Mounting shaft to frictional coupling types is assumed to be a round shaft.

Centering and Finishing When Drilling Bores in Flange Hubs

Keep the following in mind when processing bore diameters in pilot-bore products.

Centering

After adjusting the chuck so that runout of each flange hub is no more than the precision of the figure below, finish the inner diameter, guided by the figure below.

Taper ring (RfN8006) specifications

Finish as shown in the figure below if you are processing for a connection by means of a taper ring (RfN8006).

Finishing/mounting example

The example shows a pilot-bore type of flange hub processed for a POSI-LOCK PSL-K, a shaft lock made by Miki Pulley, and connected to a straight shaft.

Centering

Parallel misalignment (ϵ)

Lock the dial gauge in place on one shaft and then measure the runout of the paired flange hub's outer periphery while rotating that shaft. Since couplings on which the elements (discs) are a set SFS(S) types do not allow parallel misalignment, get as close to zero as possible. For couplings that allow the entire length to be freely set SFS(G) types, use the following formula to calculate allowable parallel misalignment.

$$\epsilon = \tan \theta \times LG$$

ϵ : Allowable parallel misalignment
 θ : 1°

$$LG = LS + S$$

LS: Total length of spacer
 S: Dimension of gap between flange hub and spacer

Angular deflection (θ)

Lock the dial gauge in place on one shaft and then measure the runout of the end surface near the paired flange hub's outer periphery while rotating that shaft.

Adjust runout B so that $\theta \leq 1^\circ$ in the following formula.

$$B = D \times \tan \theta$$

B: Runout
 D: Flange hub outer diameter
 θ : 1°

Axial displacement (S)

In addition, restrict the dimension between flange hub faces (S in the diagram) within the allowable error range for axial displacement with respect to a reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

*On the SFS(S), this is the dimension of the gap between two flange hubs. On the SFS(W/G), dimension S is the gap between the flange hub and the spacer.

Mounting

This assembly method mounts a flange hub on each shaft of the SFS models and couples shafts in both directions by mounting the element last, while centering.

- (1) Remove any rust, dust, oil residue, etc. from inner diameter surfaces of the shaft and flange hubs. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Insert each shaft far enough into the flange hub that the paired mounting shaft touches the shaft along the entire length of the flange hub (LF dimension), as shown in the diagram below, and does not interfere with the elements, spacers or the other shaft.

- (3) Mount the other flange hub on the paired mounting shaft as described in steps (1) and (2).
- (4) Keep the width of the dimension between flange hub faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Coupling size	05	06	08	09	10	12	14
S [mm]	5	6	6	8	10	11	12

- (5) Insert the element into the gap between the two flange hubs, and then mount it with the reamer bolt for locking the element in place. Check that the element is not deformed. If it is, it may be under an axial force or there may be insufficient lubrication between the collar, bolt, and disc, so adjust to bring it to normal. The situation may be improved by applying a small amount of machine oil to the bearing surface of the reamer bolt. However, never use any oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based) which would dramatically affect the friction coefficient.
- (6) Use a calibrated torque wrench to tighten all the reamer bolts to the tightening torques of the table below.

Coupling size	05	06	08	09	10	12	14
Reamer bolt size	M5	M6	M6	M8	M8	M10	M12
Tightening torque [N·m] Black oxide finish (standard) specification	8	14	14	34	34	68	118
Tightening torque [N·m] Electroless nickel plating [° C] specification	6	11	11	26	26	51	90

Mounting (Frictional Coupling Hub Types)

This assembly method mounts a flange hub on each shaft of the SFS (frictional coupling hub) type and couples both shafts by mounting the element last while centering.

- (1) Loosen the pressure bolts of the flange hubs, check that the sleeve can move freely, and then remove any rust, dust, oil residue, etc. from the inner diameter surfaces of the shaft and flange hubs. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Insert each shaft far enough into the flange hub that the paired mounting shaft touches the shaft along the entire length of the flange hub (LF dimension), as shown in the diagram below, and does not interfere with the elements, spacers or the other shaft. Then, holding them in place, tighten the pressure bolts evenly, a little at a time on the diagonal, following the tightening sequence shown in the figure below.

- (3) Mount the other flange hub on the paired mounting shaft as described in steps (1) and (2).
- (4) Keep the width of the dimension between flange hub faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Coupling size	06	08	09	10	12	14
S [mm]	6	6	8	10	11	12

- (5) Insert the element into the gap between the two flange hubs, and then mount it with the reamer bolt for locking the element in place. Check that the element is not deformed. If it is, it may be under an axial force or there may be insufficient lubrication between the collar, bolt, and disc, so adjust to bring it to normal. The situation may be improved by applying a small amount of machine oil to the bearing surface of the reamer bolt. However, never use any oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based) which would dramatically affect the friction coefficient.
- (6) Use a calibrated torque wrench to tighten all the reamer and pressure bolts to the tightening torques of the table below.

Coupling size	06	08	09	10	12	14
Reamer bolt size	M6	M6	M8	M8	M10	M12
Tightening torque [N·m]	14	14	34	34	68	118
Pressure bolt size	M5	M6	M6	M6	M8	M8
Tightening torque [N·m]	8	14	14	14	34	34

- (7) To protect against initial loosening of the pressure bolts, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

Items Checked for Design Purposes

Mounting (When Mounted After Coupling Is Completed)

This assembly method first completes the coupling and then inserts it onto the shaft.

- (1) Remove any rust, dust, oil or the like from the inner diameter surfaces of the shaft and flange hubs. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
For types that use frictional coupling, loosen the flange hub's pressure bolt and check that the sleeve can move freely.
- (2) Be careful when inserting the couplings into the shaft so as not to apply excessive force of compression or tensile force to the element. Be particularly careful not to mistakenly apply excessive compression force when inserting couplings into the paired shaft after mounting on one shaft.
- (3) For frictional coupling types, with the pressure bolts loosened, make sure that couplings move gently in the axial and rotational directions. Readjust the centering of the two shafts if the couplings fail to move smoothly enough.
- (4) Insert each shaft far enough into the flange hub that the paired mounting shaft touches the shaft along the entire length of the flange hub (LF dimension), as shown in the diagram below. Then position it so that it does not interfere with the elements, spacers or the other shaft and lock it in place. For frictional coupling types, tighten the pressure bolts evenly, a little at a time on the diagonal, following the tightening sequence shown in the figure below.

- (5) Keep the width of the dimension between flange hub faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Coupling size	05	06	08	09	10	12	14
S [mm]	5	6	6	8	10	11	12

- (6) Use a calibrated torque wrench to tighten all the pressure bolts to the appropriate tightening torques of the table below.

Coupling size	06	08	09	10	12	14
Pressure bolt size	M5	M6	M6	M6	M8	M8
Tightening torque [N·m]	8	14	14	14	34	34

- (7) To protect against initial loosening of the pressure bolts, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

Removal

- (1) Check to confirm that there is no torque or axial direction load being applied to the coupling. There may be cases where a torque is applied to the coupling, particularly when the safety brake is being used. Make sure to verify that this is not occurring before removing parts.
- (2) Loosen all the pressure bolts placing pressure on the sleeve until the gap between bearing seat and sleeve is about 2 mm.
In the case of a tapered coupling system, the mechanism will be self-locking, so the coupling between flange hub and shaft cannot be released. (Note that in some cases, a coupling can be released.) For that reason, when designing couplings, a space must be installed for inserting a detachment screw. If there is no space in the axial direction, consult Miki Pulley.

- (3) Pull out two of the pressure bolts loosened in step (2), insert them into detachment screw holes at two locations on the sleeve, and tighten them alternately, a little at a time. The coupling between the flange hub and shaft will be released.

Coupling size	06	08	09	10	12	14
Nominal diameter of pressure bolt X Length	M5 × 20	M6 × 24	M6 × 24	M6 × 24	M8 × 25	M8 × 25
Recommended N dimension [mm]	26	30	30	30	31.5	31.5

Limit Rotation Speed

For SFS(G) long spacer types, the speed at which the coupling can be used will vary with the length of spacer selected. Use the following table to confirm that the speed you will use is at or below the limit rotation speed. When a max. rotation speed is set for a specific type, that speed is the upper limit.

Points to Consider Regarding the Feed Screw System

In feed screw systems using a stepper motor or servo motor, the pulsation natural frequency of the stepper motor and the torsional natural frequency of the system as a whole may cause the system to resonate, or the gain adjustment of the servo motor may cause the system to oscillate.

If resonance occurs, the resonant rotation speed must be skipped, or if oscillation occurs, adjustment will need to be made such as by using the filter function or other electrical control system to resolve the issue.

In either instance, to handle resonance and oscillation, it will be necessary to take into account the torsional natural frequency for the system overall during the design stage, including the torsional stiffness for the coupling and feed screw section and the moment of inertia and other characteristics. Please contact Miki Pulley with any questions regarding these issues.

How to Find the Natural Frequency of a Feed Screw System

Select a coupling based on the nominal and maximum torque of the stepper motor or servo motor.

Next, find the overall natural frequency, N_f , from the torsional stiffness of the coupling and feed screw, κ , the moment of inertia of driving side, J_1 , and the moment of inertia of driven side, J_2 , for the feed screw system shown below.

Natural frequency of overall feed screw system N_f [Hz]

$$N_f = \frac{1}{2\pi} \sqrt{\kappa \left(\frac{1}{J_1} + \frac{1}{J_2} \right)}$$

κ : Torsional stiffness of the coupling and feed screw [N·m/rad]
 J_1 : Moment of inertia of driving side [kg·m²]
 J_2 : Moment of inertia of driven side [kg·m²]

Torsional spring constant of coupling and feed screw κ [N·m/rad]

$$\frac{1}{\kappa} = \frac{1}{\kappa_c} + \frac{1}{\kappa_b}$$

κ_c : Torsional spring constant of coupling [N·m/rad]
 κ_b : Torsional spring constant of feed screw [N·m/rad]

Driving moment of inertia J_1 [kg·m²]

$$J_1 = J_m + \frac{J_c}{2}$$

J_m : Moment of inertia of servomotor [kg·m²]
 J_c : Moment of inertia of coupling [kg·m²]

Driven moment of inertia J_2 [kg·m²]

$$J_2 = J_b + J_t + \frac{J_c}{2}$$

J_b : Moment of inertia of feedscrew [kg·m²]
 J_t : Moment of inertia of table [kg·m²]
 J_c : Moment of inertia of coupling [kg·m²]

Moment of inertia of table J_t [kg·m²]

$$J_t = \frac{M \times P^2}{4\pi^2}$$

M : Mass of table [kg]
 P : Lead of feed screw [m]

Since it is easier for oscillation to occur when the gain margin with natural frequency is 10 dB or lower, it is necessary for the natural frequency to be set high with a therefore higher gain margin at the design stage, or to adjust the natural frequency using the servomotor's electric tuning function (filter function) so as to avoid oscillation.

Selection Procedures

- (1) Find the torque, T_a , applied to the coupling using the output capacity, P , of the driver and the usage rotation speed, n .

$$T_a [\text{N} \cdot \text{m}] = 9550 \times \frac{P [\text{kW}]}{n [\text{min}^{-1}]}$$

- (2) Determine the factor κ from the load properties, and find the corrected torque, T_d , applied to the coupling.

$T_d = T_a \times K$ (Refer to the table below for values)

	Constant	Vibrations: Small	Vibrations: Medium	Vibrations: Large
Load properties				
K	1.0	1.25	1.75	2.25

For servo motor drive, multiply the maximum torque, T_s , by the usage factor $K = 1.2$ to 1.5 .

$T_d = T_s \times (1.2 \text{ to } 1.5)$

- (3) Set the size so that the rated coupling torque, T_n , is higher than the corrected torque, T_d .

$T_n \geq T_d$

- (4) The rated torque of the coupling may be limited by the bore diameter of the coupling. See the table showing the bore diameters that limit rated torque.

- (5) Check that the mount shaft is no larger than the maximum bore diameter of the coupling.

Contact Miki Pulley for assistance with any device experiencing extreme periodic vibrations.

Items Checked for Design Purposes

Special items to take note of

You should note the following to prevent any problems.

- (1) Always be careful of parallel, angular, and axial misalignment.
- (2) Always tighten bolts with the specified torque.

Precautions for handling

Couplings are assembled at high accuracy using a special mounting jig to ensure accurate concentricity of left and right internal diameters.

Take extra precautions when handling couplings, should strong shocks be given on couplings, it may affect mounting accuracy and cause the parts to break during use.

- (1) Couplings are designed for use within an operating temperature range of -30°C to 120°C . Although the couplings are designed to be waterproof and oilproof, do not subject them to excessive amounts of water and oil as it may cause part deterioration.
- (2) Handle the element with care as it is made of a thin stainless steel metal disc, also making sure to be careful so as not to injure yourself.
- (3) Do not tighten up clamping bolts or pressure bolts until after inserting the mounting shaft.
- (4) Mounting shaft is assumed to be a round shaft.

Mounting (Clamping)

- (1) Check that coupling clamping bolts have been loosened and remove any rust, dust, oil residue, etc. from the inner diameter surfaces of the shaft and couplings. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Be careful when inserting the couplings into the shaft so as not to apply excessive force of compression or tensile force to the element.
- (3) Ensure that the length of the coupling inserted onto the motor shaft touches the shaft for the entire length of the clamping hub of the coupling (LF dimension), as shown in the diagram below, and position it so that it does not interfere with the elements, spacers or the other shaft. Then temporarily tighten the two clamping bolts, tightening them alternately until the coupling cannot be manually rotated.

Model (Clamping)	LF dimension [mm]
SFF-040	17.5
SFF-050	21.5
SFF-060	24
SFF-070	25
SFF-080 · 090	30
SFF-100 · 120	40

- (4) Hold a dial gauge against the outer diameter of the clamping hub on the motor shaft side (the surface processed simultaneously with the inner diameter), and then tighten the two clamping bolts while turning the motor shaft by hand and adjusting the difference in the runout values at A and B in the figure next is 0.02 mm or less (and as close to 0 as possible)

- (5) Alternately fasten the two clamping bolts as you adjust them, and finish by tightening both bolts to the appropriate tightening torque of the following table, using a calibrated torque wrench. Since it is fastened by two clamping bolts, tightening one bolt before the other will place more than the prescribed axial force on the bolt tightened first when the other bolt is tightened. Be sure to tighten them alternately, a little at a time.

Clamping bolt nominal diameter	Tightening torque [N·m]		
	Standard	Clean room compatible	
		CC Low dust	CF Fluorine
M4	3.4	4.5	4.5
M5	7	9	8.5
M6	14	16	16
M8	34	37	45
M10	68	68	65

- (6) Mount the motor, to which the coupling has already been mounted, on the body of the machinery. At that time, adjust the motor mounting position (centering location) while inserting the coupling onto the driven shaft (a feed screw or the like), being alert to undue forces on the element such as compression or pulling.
- (7) Make the length of the driven shaft (feed screw or the like) inserted into the coupling connect to the shaft for the length of the LF dimension (described above), alternately tighten the two clamping bolts, and provisionally tighten enough that the coupling cannot be manually rotated.
- (8) In addition, keep the dimension between clamping hub faces (the S dimension in the diagram) to within the allowable misalignment of the axial displacement with respect to a reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Model (Clamping)	S dimension [mm]
SFF-040	3.9
SFF-050 · 060	5.4
SFF-070	5.9
SFF-080 (-150N)	8.3
SFF-080 (-200N)	7.7
SFF-090	8.3
SFF-100 · 120	10.2

- (9) Adjust runout using the same procedure as for the motor shaft side, and then finish by tightening the clamping bolts to the appropriate tightening torque.
- (10) To protect against initial loosening of the clamping bolt, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

■ Mounting (Wedge coupling)

- (1) Check that coupling pressure bolts have been loosened and remove any rust, dust, oil residue, etc. from the inner diameter surfaces of the shaft and couplings. In particular, never allow oil or grease containing antifricition or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Be careful when inserting the couplings into the shaft so as not to apply excessive force of compression or tensile force to the element.
- (3) Insert each coupling far enough onto the motor shaft that it touches the shaft along the entire length of the coupling flange (LF dimension), as shown in the diagram below. Position it so that it does not interfere with the elements, spacers or the other shaft and then hold it in place.

Model (Wedge coupling)	LF dimension [mm]
SFF-070	23.5
SFF-080 · 090	25.5
SFF-100 · 120	27.5
SFF-140	36.5

- (4) Using the drive pin hole, lightly tighten the pressure bolt on the diagonal.
- (5) Touch the dial gauge to the flange end face or outer diameter on the motor shaft side. Then, while gently rotating the motor shaft manually, adjust the flange periphery and end face by hammering until the runout is as close to zero as possible.

- (6) Sequentially fasten the pressure bolts while doing hammering adjustments, and then use a calibrated torque wrench to tighten all the pressure bolts to the appropriate tightening torques below. See the following figure for the tightening procedure for the pressure bolts. Try to tighten them evenly.

Pressure bolt nominal diameter	Tightening torque [N·m]
M6	10
M8	24

- (7) Tighten the motor shaft's pressure bolts at the nominal torque and check that the runout value is low.
- (8) Mount the motor, to which the coupling has already been mounted, on the body of the machinery. At that time, adjust the motor mounting position (centering location) while inserting the coupling onto the driven shaft (a feed screw or the like), taking care to not deform the disc. Also insert each coupling far enough onto the paired shaft that it touches the shaft along the entire length of the coupling flange (LF dimension) and then hold it in that position.

- (9) Keep the width of the dimension between flange faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Model	S dimension [mm]
SFF-070	5.9
SFF-080 (-150N)	8.3
SFF-080 (-200N)	7.7
SFF-090	8.3
SFF-100 · 120	10.2
SFF-140	10.6

- (10) Sequentially tighten the pressure bolts on the driven shaft (a feed screw or the like) side using the same procedure as for the motor shaft side pressure bolts, and then tighten to the appropriate tightening torque.
- (11) To protect against initial loosening of the pressure bolt, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

Items Checked for Design Purposes

Removal

- (1) Check to confirm that there is no torque or axial load being applied to the coupling. There may be cases where a torque is applied to the coupling, particularly when the safety brake is being used. Make sure to verify that this is not occurring before removing parts.
- (2) Loosen all the clamping bolts or pressure bolts (loosen pressure bolts until the gap between bearing seat and sleeve is about 2mm).
- (3) For clamping type, release the fastening to the shaft by sufficiently loosening all clamping bolts. Note that grease has been applied to the clamping bolts, so do not remove them all the way.
- (4) In the case of a wedge coupling system that tightens a pressure bolt from the axial direction, the sleeve will be self-locking, so the coupling between flange and shaft cannot be released simply by loosening the pressure bolt. (Note that in some cases, a coupling can be released by loosening a pressure bolt.) For that reason, when designing devices, a space must be installed for inserting a detachment screw.

- (5) Pull out three of the pressure bolts (two 080, 150 N) loosened in step (2), insert them into the detachment screw holes on the sleeve, and tighten them in order, a little at a time. The coupling will be released.
- (6) If there is no space in the axial direction, insert the tip of a flathead screwdriver or the like into part A and lightly tap perpendicular to the shaft or use it as a lever to pry off the coupling. Use appropriate caution to not damage the coupling body or the pressure bolts.

Differences in torsional stiffness due to element shape

Elements used by SFF models may be either square or hexagonal. Since torque is transmitted by coupling the hubs to each other via the element, torsional stiffness is higher in couplings that use hexagonal elements transmitting torque with six bolts, at the expense of some flexibility. Choose your element shape accordingly.

Model (nominal rated torque)	Element shape
SFF-040	Square
SFF-050	Square
SFF-060	Hexagonal
SFF-070	Hexagonal
SFF-080 (150N)	Square
SFF-080 (120N · 200N)	Hexagonal
SFF-090	Hexagonal
SFF-100	Hexagonal
SFF-120	Hexagonal
SFF-140	Hexagonal

Center nut for tapered shafts

The center nut designated for clamping-type sizes 040/050/060 is shipped pre-installed depending on the opposite coupling-end bore diameter. Check the table below.

Clamping hub type model	Center nut installation
SFF-040□-□B-11CN-8N	All pre-installed
SFF-040□-□B-11CN-12N	Installed where d1 < 12mm
SFF-050□-□B-14CN-25N	Installed where d1 < 15mm
SFF-050□-□B-16CN-25N	Installed where d1 < 16mm
SFF-060□-□B-16CN-60N	Installed where d1 < 16mm
SFF-060□-□B-16CN-80N	All bundled

Flange mounted

You must prepare bolts separately for mounting of flange-mounted models of clamping-type sizes 070 to 120.

Before mounting at the flange end, check the device and material being mounted to, strength classification of bolts, etc. for appropriate mounting.

Clamping and wedge coupling in combination

For the range of common sizes between clamping and wedge coupling (070 - 120), a common element is used per each size allowing you to use them in combination.

When specifying bore diameters in this instance, specify d1: clamping, d2: wedge coupling in that order, regardless of larger and smaller bore diameters.

Example)

SFF-080SS-30B-25K-200N

Rated torques after combination are given for the clamping side. See the table below.

d1 clamping (designation B)		d2 wedge coupling (designation K)		Rated torque after combination [N · m]

Points to consider regarding the feed screw system

Gain adjustment in feed screw systems using a servo motor may cause the servo motor to oscillate. If oscillation occurs, adjustment will need to be made such as by using the filter function or other electrical control system to resolve this issue.

To handle issues such as oscillation, it will be necessary to take into account the torsional natural frequency for the system overall during the design stage, including the torsional stiffness for the coupling and feed screw section and the moment of inertia and other characteristics.

How to find the natural frequency of a feed screw system

Select a coupling based on the standard torque or maximum torque of the servo motor.

Next, find the overall natural frequency, N_f , from the torsional stiffness of the coupling and feed screw, K , the moment of inertia of driving side, J_1 , and the moment of inertia of driven side, J_2 , for the feed screw system shown below.

Natural frequency of overall feed screw system N_f [Hz]

$$N_f = \frac{1}{2\pi} \sqrt{K \left(\frac{1}{J_1} + \frac{1}{J_2} \right)}$$

K : Torsional stiffness of the coupling and feed screw [$\text{N} \cdot \text{m/rad}$]
 J_1 : Moment of inertia of driving side [$\text{kg} \cdot \text{m}^2$]
 J_2 : Moment of inertia of driven side [$\text{kg} \cdot \text{m}^2$]

Torsional spring constant of coupling and feed screw K [$\text{N} \cdot \text{m/rad}$]

$$\frac{1}{K} = \frac{1}{K_c} + \frac{1}{K_b}$$

K_c : Torsional spring constant of coupling [$\text{kg} \cdot \text{m}^2$]
 K_b : Torsional spring constant of feed screw [$\text{kg} \cdot \text{m}^2$]

Driving moment of inertia J_1 [$\text{kg} \cdot \text{m}^2$]

$$J_1 = J_m + \frac{J_c}{2}$$

J_m : Moment of inertia of servomotor [$\text{kg} \cdot \text{m}^2$]
 J_c : Moment of inertia of coupling [$\text{kg} \cdot \text{m}^2$]

Driven moment of inertia J_2 [$\text{kg} \cdot \text{m}^2$]

$$J_2 = J_b + J_t + \frac{J_c}{2}$$

J_b : Moment of inertia of feedscrew [$\text{kg} \cdot \text{m}^2$]
 J_t : Moment of inertia of table [$\text{kg} \cdot \text{m}^2$]
 J_c : Moment of inertia of coupling [$\text{kg} \cdot \text{m}^2$]

Moment of inertia of table J_t [$\text{kg} \cdot \text{m}^2$]

$$J_t = \frac{M \times P^2}{4\pi^2}$$

M : Mass of table [kg]
 P : Lead of feed screw [m]

Since it is easier for oscillation to occur when the gain margin with natural frequency is 10 dB or lower, it is necessary for the natural frequency to be set high with a therefore higher gain margin at the design stage, or to adjust the natural frequency using the servomotor's electric tuning function (filter function) so as to avoid oscillation.

Selection

- (1) Find the torque T_a applied to the coupling using the output capacity, P , of the driver and the usage speed, n .

$$T_a [\text{N} \cdot \text{m}] = 9550 \times \frac{P [\text{kW}]}{n [\text{min}^{-1}]}$$

- (2) Determine the factor K from the load properties, and find the corrected torque, T_d , applied to the coupling.

$$T_d [\text{N} \cdot \text{m}] = T_a [\text{N} \cdot \text{m}] \times K \text{ (see below)}$$

Load properties	Constant	Vibration : Small	Vibration : Medium	Vibration : Large
K	1.0	1.25	1.75	2.25

For servo motor drive, multiply the maximum torque, T_s , by the usage factor $K = 1.2$ to 1.5 .

$$T_d [\text{N} \cdot \text{m}] = T_s [\text{N} \cdot \text{m}] \times (1.2 \text{ to } 1.5)$$

- (3) Set the size so that the rated coupling torque, T_n , is higher than the corrected torque, T_d .

$$T_n [\text{N} \cdot \text{m}] \geq T_d [\text{N} \cdot \text{m}]$$

- (4) The rated torque of the coupling may be limited by the bore diameter of the coupling. See the Specifications and Standard Bore Diameters tables.
- (5) Check that the mount shaft is no larger than the maximum bore diameter of the coupling.

* Contact MIKI PULLEY for assistance with any device experiencing extreme periodic vibrations.

Items Checked for Design Purposes

Special Items to Take Note of

You should note the following to prevent any problems.

- (1) Always be careful of parallel, angular, and axial misalignment.
- (2) Always tighten bolts with the specified torque.

Precautions for Handling

Couplings are assembled at high accuracy using a special mounting jig to ensure accurate concentricity of left and right internal diameters. Take extra precautions when handling couplings, should strong shocks be given on couplings, it may affect mounting accuracy and cause the parts to break during use.

- (1) Couplings are designed for use within an operating temperature range of -30°C to 120°C . Although the couplings are designed to be waterproof and oilproof, do not subject them to excessive amounts of water and oil as it may cause part deterioration.
- (2) Handle the element with care as it is made of a thin stainless steel metal disc, also making sure to be careful so as not to injure yourself.
- (3) Do not tighten up clamping bolts or pressure bolts until after inserting the mounting shaft.
- (4) Mounting shaft is assumed to be a round shaft.

Mounting (Clamping)

- (1) Check that coupling clamping bolts have been loosened and remove any rust, dust, oil residue, etc. from the inner diameter surfaces of the shaft and couplings. In particular, never allow oil or grease containing antifriction or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Be careful when inserting the couplings onto the shaft so as not to apply excessive force of compression or tensile force to the element.
- (3) Ensure that the length of the coupling inserted onto the motor shaft touches the shaft for the entire length of the clamping hub of the coupling (LF dimension), as shown in the diagram below, and position it so that it does not interfere with the elements, spacers or the other shaft. Then temporarily tighten the two clamping bolts, tightening them alternately until the coupling cannot be manually rotated.

Model (Clamping)	LF dimension [mm]
SFM-060	24
SFM-070	25
SFM-080	30
SFM-090	30
SFM-100	40
SFM-120	40

- (4) Hold a dial gauge against the outer diameter of the clamping hub on the motor shaft side (the surface processed simultaneously with the inner diameter), and then tighten the two clamping bolts while turning the motor shaft by hand and adjusting the difference in the runout values at A and B in the figure below is 0.02 mm or less (and as close to 0 as possible).

- (5) Alternately fasten the two clamping bolts as you adjust them, and finish by tightening both bolts to the appropriate tightening torque of the following table, using a calibrated torque wrench. Since it is fastened by two clamping bolts, tightening one bolt before the other will place more than the prescribed axial force on the bolt tightened first when the other bolt is tightened. Be sure to tighten them alternately, a little at a time.

Clamping bolt nominal diameter	Tightening torque [N·m]
M5	7
M6	14
M8	34
M10	68

- (6) Mount the motor, to which the coupling has already been mounted, on the body of the machinery. At that time, adjust the motor mounting position (centering location) while inserting the coupling onto the driven shaft, being alert to undue forces on the element such as compression or pulling.
- (7) Make the length of the driven shaft inserted into the coupling connect to the shaft for the length of the LF dimension (described above), alternately tighten the two clamping bolts, and provisionally tighten enough that the coupling cannot be manually rotated.
- (8) In addition, keep the dimension between clamping hub faces (the S dimension in the diagram) to within the allowable misalignment of the axial displacement with respect to a reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Model (Clamping)	S dimension [mm]
SFM-060	5.4
SFM-070	5.9
SFM-080 (-150N)	8.3
SFM-080 (-200N)	7.7
SFM-090	8.3
SFM-100	10.2
SFM-120	10.2

- (9) Adjust runout using the same procedure as for the motor shaft side, and then finish by tightening the clamping bolts to the appropriate tightening torque.
- (10) To protect against initial loosening of the clamping bolt, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

I Mounting (Wedge Coupling)

- (1) Check that coupling pressure bolts have been loosened and remove any rust, dust, oil residue, etc. from the inner diameter surfaces of the shaft and couplings. In particular, never allow oil or grease containing antifricition or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.
- (2) Be careful when inserting the couplings into the shaft so as not to apply excessive force of compression or tensile force to the element.
- (3) Insert each coupling far enough onto the motor shaft that it touches the shaft along the entire length of the coupling flange (LF dimension), as shown in the diagram below. Position it so that it does not interfere with the elements, spacers or the other shaft and then hold it in place.

Model (Wedge coupling)	LF dimension [mm]
SFM-070	23.5
SFM-080	25.5
SFM-090	25.5
SFM-100	27.5
SFM-120	27.5
SFM-140	36.5

- (4) Using the drive pin hole, lightly tighten the pressure bolt on the diagonal.

- (5) Touch the dial gauge to the flange end face or outer diameter on the motor shaft side. Then, while gently rotating the motor shaft manually, adjust the flange periphery and end face by hammering until the runout is as close to zero as possible.

- (6) Sequentially fasten the pressure bolts while doing hammering adjustments, and then use a calibrated torque wrench to tighten all the pressure bolts to the appropriate tightening torques below. See the following figure for the tightening procedure for the pressure bolts. Try to tighten them evenly.

Pressure bolt nominal diameter	Tightening torque [N·m]
M6	10
M8	24

- (7) Tighten the motor shaft's pressure bolts at the nominal torque and check that the runout value is low.
- (8) Mount the motor, to which the coupling has already been mounted, on the body of the machinery. At that time, adjust the motor mounting position (centering location) while inserting the coupling onto the driven shaft, being alert to any deformation of the disc, etc. Make the length of the driven shaft inserted into the coupling be in contact with the entire length of the coupling flange (LF dimension), and maintain it at that position.

- (9) Keep the width of the dimension between flange faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

Model	S dimension [mm]
SFM-070	5.9
SFM-080 (-150N)	8.3
SFM-080 (-200N)	7.7
SFM-090	8.3
SFM-100	10.2
SFM-120	10.2
SFM-140	10.6

- (10) Tighten the pressure bolts on the driven shaft in order using the same procedure as for the pressure bolts on the motor shaft side, and then finish by tightening to the appropriate tightening torque.

- (11) To protect against initial loosening of the pressure bolt, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

Important when Combining for High-Revolution (Main Shaft) Applications

For high-revolution applications such as a machining center main shaft, vibration can become an issue.

One cause of vibration at high revolutions is misalignment of shaft axes when combining the spindle motor and the main shaft, with vibration still occurring even with balance correction of the coupling itself.

While it is possible to allow for some misalignment occurring as parallel, angular, or axial displacement, it is particularly important to take care with misalignment with high-revolution applications. Be sure to perform axial adjustment during assembly and field balance correction after assembly.

*Couplings used in the above measurements had undergone balance correction on an individual basis.

■ Removal

- (1) Check to confirm that there is no torque or axial load being applied to the coupling. There may be cases where a torque is applied to the coupling, particularly when the safety brake is being used. Make sure to verify that this is not occurring before removing parts.
- (2) Loosen all the clamping bolts or pressure bolts (loosen pressure bolts until the gap between bearing seat and sleeve is about 2mm).
- (3) For clamping type, release the fastening to the shaft by sufficiently loosening all clamping bolts. Note that grease has been applied to the clamping bolts, so do not remove them all the way.
- (4) In the case of a wedge coupling system that tightens a pressure bolt from the axial direction, the sleeve will be self-locking, so the coupling between flange and shaft cannot be released simply by loosening the pressure bolt. (Note that in some cases, a coupling can be released by loosening a pressure bolt.) For that reason, when designing devices, a space must be installed for inserting a detachment screw.

- (5) Pull out three of the pressure bolts (two 080, 150 N) loosened in step (2), insert them into the detachment screw holes on the sleeve, and tighten them in order, a little at a time. The coupling will be released.
- (6) If there is no space in the axial direction, insert the tip of a flathead screwdriver or the like into part A and lightly tap perpendicular to the shaft or use it as a lever to pry off the coupling. Use appropriate caution to not damage the coupling body or the pressure bolts.

■ Suitable Torque Screwdriver/Torque Wrench

■ Clamping bolt

Nominal bolt diameter	Tightening torque [N · m]	Torque screwdriver/wrench	Hexagon bit/head	Coupling size
M5	7	N10LTDK	SB 4mm	060
M6	14	N25LCK	25HCK 5mm	060 · 070 · 080
M8	34	N50LCK	50HCK 6mm	080 · 090
M10	68	N100SPCK × 68N · m	100HCK 8mm	100 · 120

* Torque screwdriver (wrench)/bit (head) models are those of Nakamura Mfg. Co., Ltd.

■ Pressure bolt

Nominal bolt diameter	Tightening torque [N · m]	Torque wrench	Spanner head	Coupling size
M6	10	N12SPCK × 10N · m	25SCK 10mm	070 ~ 120
M8	24	N50SPCK × 24N · m	50SCK 13mm	140

* Torque wrench/spanner head models are those of Nakamura Mfg. Co., Ltd.

■ Differences in Torsional Stiffness due to Element Shape

Elements used by SFM models may be either square or hexagonal. Since torque is transmitted by coupling the hubs to each other via the element, torsional stiffness is higher in couplings that use hexagonal elements transmitting torque with six bolts, at the expense of some flexibility. Choose your element shape accordingly.

Model (nominal rated torque)	Element shape
SFM-060	Hexagonal
SFM-070	Hexagonal
SFM-080 (-150N)	Square
SFM-080 (-200N)	Hexagonal
SFM-090	Hexagonal
SFM-100	Hexagonal
SFM-120	Hexagonal
SFM-140	Hexagonal

■ Clamping and Wedge Coupling in Combination

For the range of common sizes between clamping and wedge coupling (070 - 120), a common element is used per each size allowing you to use them in combination.

When specifying bore diameters in this instance, specify d1: clamping, d2: wedge coupling in that order, regardless of larger and smaller bore diameters.

Example) SFM-080SS-30B-25K-200N-G2.5/24000

Rated torques after combination are given for the clamping side. See the table below.

d1 clamping (designation B)		d2 wedge coupling (designation K)		Rated torque after combination [N·m]
Model	Bore diameter range [mm]	Model	Bore diameter range [mm]	
SFM-070 (-90N)	18 · 19	SFM-070 (-100N)	18 ~ 35	90
SFM-070 (-100N)	20 ~ 35	SFM-070 (-100N)	18 ~ 35	100
SFM-080 (-150N)	22 ~ 35	SFM-080 (-150N)	22 ~ 38	150
SFM-080 (-200N)	22 ~ 38	SFM-080 (-200N)	22 ~ 38	200
SFM-090 (-250N)	25 · 28	SFM-090 (-300N)	28 ~ 48	250
SFM-090 (-300N)	30 ~ 42	SFM-090 (-300N)	28 ~ 48	300
SFM-100 (-450N)	32 ~ 48	SFM-100 (-450N)	32 ~ 50	450
SFM-120 (-600N)	32 ~ 55	SFM-120 (-600N)	35 ~ 70	600

Selection Procedures

- (1) Find the torque, T_a , applied to the coupling using the output capacity, P , of the driver and the usage rotation speed, n .

$$T_a \text{ [N}\cdot\text{m]} = 9550 \times \frac{P \text{ [kW]}}{n \text{ [min}^{-1}\text{]}}$$

- (2) Determine the factor K from the load properties, and find the corrected torque, T_d , applied to the coupling.

$$T_d \text{ [N}\cdot\text{m]} = T_a \text{ [N}\cdot\text{m]} \times K \text{ (Refer to the table below for values)}$$

	Constant	Vibrations: Small	Vibrations: Medium	Vibrations: Large
Load properties				
K	1.0	1.25	1.75	2.25

For servo motor drive, multiply the maximum torque, T_s , by the usage factor $K = 1.2$ to 1.5 .

$$T_d \text{ [N}\cdot\text{m]} = T_s \text{ [N}\cdot\text{m]} \times (1.2 \sim 1.5)$$

For high-revolution applications such as a machining center main shaft, it is necessary to set a high safety factor unlike common feed screw systems.

Multiply the maximum torque of spindle motor: T_s by the service factor: $K=3$ to 3.6 .

$$T_d \text{ [N}\cdot\text{m]} = T_s \text{ [N}\cdot\text{m]} \times (3 \sim 3.6)$$

- (3) Set the size so that the rated coupling torque, T_n , is higher than the corrected torque, T_d .

$$T_n \text{ [N}\cdot\text{m]} \geq T_d \text{ [N}\cdot\text{m]}$$

- (4) Check that the mount shaft is no larger than the maximum bore diameter of the coupling.

* Contact Miki Pulley for assistance with any device experiencing extreme periodic vibrations.

SFH-260G	50	55	115	262	166	391	100	145	23	11	150	12-M20 × 80

* Pilot bores are to be drilled into the part. See the standard hole-drilling standards of JIS for information on bore drilling.

* If you require a product with an LS dimension that exceeds those above, contact Miki Pulley with your required dimension [mm]. Please contact Miki Pulley for assistance if the LS dimension is less than those above or if $LS \geq 1000$.

* The nominal diameter of the reamer bolt is equal to the quantity minus the nominal diameter of the screw threads times the nominal length.

How to Place an Order

SFH-150G-38H-38H LS=500

Size
Type: G
Double element
Floating shaft
Bore diameter: d1 (Small diameter) - d2 (Large diameter)
Blank: Pilot bore
Spacer length
*Use mm units for LS dimensions.
*Leave blank for standard spacers.
Bore specifications
Blank: Compliant with the old JIS standards (class 2) E9
H: Compliant with JIS standards H9
N: Compliant with motor standards

Maximum LS Dimension When Used Vertically

Model	LS [mm]
SFH-150G	1100
SFH-170G	800
SFH-190G	900
SFH-210G	2000
SFH-220G	1900
SFH-260G	2500

* When considering vertical use and the LS dimension is greater than that in the above table, consult Miki Pulley.

Specification (SFH-□G-□K-□K) Frictional Coupling

Model	Rated torque [N·m]	Misalignment			Max. rotation speed [min ⁻¹]	Torsional stiffness [N·m/rad]	Axial stiffness [N/mm]	Moment of inertia [kg·m ²]	Mass [kg]
		Parallel [mm]	Angular [°]	Axial [mm]					
SFH-150G	1000	1.4	1 (On one side)	± 0.8	5900	750000	122	34.41×10^{-3}	12.96
SFH-170G	1300	1.6	1 (On one side)	± 1.0	5100	1420000	112	72.09×10^{-3}	18.95
SFH-190G	2000	2.0	1 (On one side)	± 1.0	4700	1700000	122	98.15×10^{-3}	23.14
SFH-210G	4000	2.1	1 (On one side)	± 1.1	4300	2340000	254	137.53×10^{-3}	26.61

* Max. rotation speed does not take into account dynamic balance.

* The moment of inertia and mass in the table are measured for the maximum bore diameter.

Dimensions (SFH-□G-□K-□K) Frictional Coupling

■ Set screw position

Model	Distance from edge [mm]
SFH-150	15
SFH-170	20
SFH-190	25
SFH-210	30
SFH-220	35
SFH-260	40

■ NOTE

- Positions of set screws and keyways are not on the same plane.
- Set screws are included with the product.
- Positioning precision for keyway milling is determined by sight.
- Contact Miki Pulley when the keyway requires a positioning precision for a particular flange hub.
- Consult the technical documentation at the end of this volume for standard dimensions for bore drilling other than those given here.

■ Centering and Finishing when Drilling Bores in Flange Hubs

SFH models are delivered in component form. When processing bore diameters in pilot-bore products in particular, adjust the chuck so that runout of each flange hub is no more than the precision of the figure at right, and then finish the inner diameter.

Items Checked for Design Purposes

Special Items to Take Note of

You should note the following to prevent any problems.

- (1) Always be careful of parallel, angular, and axial misalignment.
- (2) Always tighten bolts with the specified torque.

Precautions for Handling

SFH models are delivered in component form. This mounts a flange hub on each shaft and couples both shafts by mounting the element (spacer) last, while centering. Also, the SFH(S) types can first mount an element on the flange hub, then center, and then complete the coupling before inserting it onto the shaft.

When using the assembly method that completes coupling first, take extra precautions when handling couplings. Subjecting assembled couplings to strong shocks may affect mounting accuracy and cause the parts to break during use.

- (1) Couplings are designed for use within an operating temperature range of -30°C to 120°C. Although the couplings are designed to be waterproof and oilproof, do not subject them to excessive amounts of water and oil as it may cause part deterioration.
- (2) Handle the element with care as it is made of a thin stainless steel metal disc, also making sure to be careful so as not to injure yourself.
- (3) For frictional coupling types, do not tighten up pressure bolts until after inserting the mounting shaft.
- (4) Mounting shaft to frictional coupling types is assumed to be a round shaft.

Centering

Parallel misalignment (ε)

Lock the dial gauge in place on one shaft and then measure the runout of the paired flange hub's outer periphery while rotating that shaft. Since couplings on which the elements (discs) are a set SFH(S) types do not allow parallel misalignment, get as close to zero as possible. For couplings that allow the entire length to be freely set SFH(G) types, use the following formula to calculate allowable parallel misalignment.

$$\varepsilon = \tan \theta \times LG$$

ε : Allowable parallel misalignment
 θ : 1°

$$LG = LS + S$$

LS: Total length of spacer
 S: Dimension of gap between flange hub and spacer

Angular deflection (θ)

Lock the dial gauge in place on one shaft and then measure the runout of the end surface near the paired flange hub's outer periphery while rotating that shaft.

Adjust runout B so that $\theta \leq 1^\circ$ in the following formula.

$$B = D \times \tan \theta$$

B: Runout
 D: Flange hub outer diameter
 θ : 1°

Axial displacement (S)

In addition, restrict the dimension between flange hub faces (S in the diagram) within the allowable error range for axial displacement with respect to a reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

* On the SFH(S), this is the dimension of the gap between two flange hubs. On the SFH(G), dimension S is the gap between the flange hub and the spacer.

Mounting

This assembly method mounts a flange hub on each shaft of the SFH models and couples both shafts by mounting the element (spacer) last, while centering.

- (1) Remove any rust, dust, oil or the like from the inner diameter surfaces of the shaft and flange hubs. In particular, never allow oil or grease containing antifricition or other agent (molybdenum-, silicon-, or fluorine-based), which would dramatically affect the friction coefficient, to contact the surface.

For types that use frictional coupling, loosen the flange hub's pressure bolt and check that the sleeve can move freely.

- (2) Insert the flange hub onto the paired mounting shaft. Insert each shaft far enough into the coupling so that the paired mounting shaft touches the shaft along the entire length of the flange hub (LF dimension) as shown in the diagram below, and does not interfere with the elements, spacers or the other shaft.

SFH(S) types

SFH(G) types

Coupling size	150	170	190	210	220	260
LF (key or set screw) [mm]	45	55	65	75	90	100
LF (frictional coupling) [mm]	65	65	70	73	—	—

- (3) Mount the other flange hub on the paired mounting shaft as described in steps (1) and (2).

- (4) With the flange hub inserted, center (parallel misalignment and angular deflection), and then adjust the distance between shafts.

- (5) For SFH(S) types, translate the flange hubs on the shaft, insert the element between the two flange hubs, and provisionally assemble with the reamer bolt, collar, and hexagonal nut. For SFH(G) types, insert reamer bolts from the flange side for both flanges, provisionally fasten the element and collar with a hexagonal nut, and then translate the flange hubs on the shaft, insert the spacer between the flange hubs, and provisionally assemble with the reamer bolt, collar and hexagonal nut.

SFH Models

Items Checked for Design Purposes

I Mounting

- (6) Keep the width of the dimension between flange faces (S dimension in the diagram) within the allowable error range for axial misalignment with respect to the reference value. Note that the tolerance values were calculated based on the assumption that both the level of parallel misalignment and angular deflection are zero. Adjust to keep this value as low as possible.

■ SFH(S) types

■ SFH(G) types

Coupling size	150	170	190	210	220	260
S [mm]	11	14	15	15	20	23

- (7) Check that the element is not deformed. If it is, it may be under an axial force or there may be insufficient lubrication between the collar, bolt, and disc, so adjust to bring it to normal. The situation may be improved by applying a small amount of machine oil to the bearing surface of the reamer bolt. However, never use any oil or grease containing antifricition or other agent (molybdenum-, silicon-, or fluorine-based) which would dramatically affect the friction coefficient.

- (8) Use a calibrated torque wrench to tighten all the reamer bolts to the appropriate tightening torques.

Coupling size	150	170	190	210	220	260
Reamer bolt size	M8	M10	M12	M16	M16	M20
Tightening torque [N·m]	34	68	118	300	300	570

- (9) When selecting a key system for the mounting on the shaft, lock the flange hub to the shaft with a set screw.

For frictional coupling types, tighten the pressure bolts evenly, a little at a time, on the diagonal, guided by the tightening procedure of the figure below.

Type	Pressure bolt size	Tightening torque [N·m]
SFH-150	M8	34
SFH-170	M8	34
SFH-190	M10	68
SFH-210	M10	68

- (10) To protect against initial loosening of the pressure bolts, we recommend operating for a set period of time and then retightening to the appropriate tightening torque.

I Removal

- (1) Check to confirm that there is no torque or axial load being applied to the coupling. There may be cases where a torque is applied to the coupling, particularly when the safety brake is being used. Make sure to verify that this is not occurring before removing parts.

- (2) Loosen all the pressure bolts placing pressure on the sleeve until the gap between bearing seat and sleeve is about 2 mm.

For a tapered coupling system that tightens pressure bolts from the axial direction, the sleeve will be self-locking, so the coupling between flange hub and shaft cannot be released simply by loosening the pressure bolt. (Note that in some cases, a coupling can be released by loosening a pressure bolt.) For that reason, when designing devices, a space must be installed for inserting a detachment screw.

If there is no space in the axial direction, consult Miki Pulley.

- (3) Pull out three of the pressure bolts loosened in step (2), insert them into detachment screw holes at three locations on the sleeve, and tighten them alternately, a little at a time. The link between the flange hub and shaft will be released.

Coupling size	150	170	190	210
Nominal diameter of pressure bolt × Length	M8 × 60	M8 × 60	M10 × 65	M10 × 65
Recommended N dimension [mm]	108	108	121	121

I Limit Rotation Speed

For SFH(G) long spacer types, the speeds at which the coupling can be used will vary with the length of spacer selected. Use the following table to confirm that the speed you will use is at or below the limit rotation speed.

Points to Consider Regarding the Feed Screw System

Gain adjustment in feed screw systems using a servo motor may cause the servo motor to oscillate. If oscillation occurs, adjustment will need to be made such as by using the filter function or other electrical control system to resolve this issue.

To handle issues such as oscillation, it will be necessary to take into account the torsional natural frequency for the system overall during the design stage, including the torsional stiffness for the coupling and feed screw section and the moment of inertia and other characteristics. Please contact Miki Pulley with any questions regarding servo motor oscillation.

How to Find the Natural Frequency of a Feed Screw System

Select a coupling based on the standard torque or maximum torque of the servo motor.

Next, find the overall natural frequency, N_f , from the torsional stiffness of the coupling and feed screw, κ , the moment of inertia of driving side, J_1 , and the moment of inertia of driven side, J_2 , for the feed screw system shown below.

Natural frequency of overall feed screw system N_f [Hz]

$$N_f = \frac{1}{2\pi} \sqrt{\kappa \left(\frac{1}{J_1} + \frac{1}{J_2} \right)}$$

κ : Torsional stiffness of the coupling and feed screw [N·m/rad]

J_1 : Moment of inertia of driving side [kg·m²]

J_2 : Moment of inertia of driven side [kg·m²]

Torsional spring constant of coupling and feed screw κ [N·m/rad]

$$\frac{1}{\kappa} = \frac{1}{\kappa_c} + \frac{1}{\kappa_b}$$

κ_c : Torsional spring constant of coupling [N·m/rad]

κ_b : Torsional spring constant of feed screw [N·m/rad]

Driving moment of inertia J_1 [kg·m²]

$$J_1 = J_m + \frac{J_c}{2}$$

J_m : Moment of inertia of servomotor [kg·m²]

J_c : Moment of inertia of coupling [kg·m²]

Driven moment of inertia J_2 [kg·m²]

$$J_2 = J_b + J_t + \frac{J_c}{2}$$

J_b : Moment of inertia of feedscrew [kg·m²]

J_t : Moment of inertia of table [kg·m²]

J_c : Moment of inertia of coupling [kg·m²]

Moment of inertia of table J_t [kg·m²]

$$J_t = \frac{M \times P^2}{4\pi^2}$$

M : Mass of table [kg]

P : Lead of feed screw [m]

Since it is easier for oscillation to occur when the gain margin with natural frequency is 10 dB or lower, it is necessary for the natural frequency to be set high with a therefore higher gain margin at the design stage, or to adjust the natural frequency using the servomotor's electric tuning function (filter function) so as to avoid oscillation.

Selection Procedures

- (1) Find the torque, T_a , applied to the coupling using the output capacity, P , of the driver and the usage rotation speed, n .

$$T_a [\text{N} \cdot \text{m}] = 9550 \times \frac{P [\text{kW}]}{n [\text{min}^{-1}]}$$

- (2) Determine the factor κ from the load properties, and find the corrected torque, T_d , applied to the coupling.

$T_d = T_a \times K$ (Refer to the table below for values)

Load properties	Constant	Vibrations: Small	Vibrations: Medium	Vibrations: Large
K	1.0	1.25	1.75	2.25

For servo motor drive, multiply the maximum torque, T_s , by the usage factor $K = 1.2$ to 1.5 .

$T_d = T_s \times (1.2 \text{ to } 1.5)$

- (3) Set the size so that the rated coupling torque, T_n , is higher than the corrected torque, T_d .

$T_n \geq T_d$

- (4) The rated torque of the coupling may be limited by the bore diameter of the coupling. See the table showing the bore diameters that limit rated torque.

- (5) Check that the mount shaft is no larger than the maximum bore diameter of the coupling.

Contact Miki Pulley for assistance with any device experiencing extreme periodic vibrations.

Mounting Example

■ SFH(S)

This example combines a frictional-coupling type flange and a standard bore-drilled flange hub.

■ SFH(S) special

This combines a flange hub processed for the tapered shaft of a servo motor with a flange hub processed for a Miki Pulley shaft lock PSL-G.
